The manufacturing of advanced chips relies on highly specialized equipment, materials, and processes concentrated in a few regions. The transition to 5G has intensified ...

Quantum tunnelling effects through the gate oxide layer on "7 nm" and "5 nm" transistors became increasingly difficult to manage using existing semiconductor processes. Single-transistor devices below 7 nm were first demonstrated by researchers in the early 2000s. In 2002, an IBM research team including Bruce Doris, Omer Dokumaci, Meikei Jeong and Anda Mocuta fabricated a 6-nanometre silicon-on-insulator (SOI) MOSFET.

Samsung Electronics, a world leader in advanced semiconductor technology, today introduces its newest radio frequency (RF) technology based on 8-nanometer (nm) process.

As 5G networks become the backbone of modern communication, 5G base station chips are emerging as a cornerstone of this transformation. With projections showing ...

The proposed design is carried out using 130 nm BiCMOS process technology and harmonic matching network using Chebyshev bandpass filter has been designed using on ...

In the first section, we will discuss some of the leading use cases for millimeter wave communications and set the stage for the analysis that ...

In December 2021, TSMC announced a new member of its "5 nm" process family designed for HPC applications: N4X. The process featured optimized transistor design and structures, ...

These "infill" small cells can be deployed on buildings and street lights and fixtures as well as on traditional cell towers. This smaller version gNode B allows for cost efficient deployment.

HiSilicon Hi5662 (5G Base Station Chip) Supports Massive MIMO and mmWave frequencies. High integration: Built-in baseband processing and RF frontend interfaces. Low latency for 5G ...

5g base station communication chips use a few nanometers process
