Why is Solar Integrated supercapacitor not suitable for long-time discharge?

It is due to the low energy density and fast charge/discharge rates of supercapacitors that are not capable of storing large amounts of energy. Hence, the solar integrated supercapacitor device is less suitable as a durable power source for long-time discharge.

Can a supercapacitor provide better energy density without sacrificing power density?

This type of hybrid system offers the possibility of providing better energy density without sacrificing the power density [22,24]. This paper is distinctive in its approach, addressing fundamentals such as charge storage mechanisms and providing an extensive discussion of components and advancements in supercapacitor technology.

Do supercapacitors have a long-term stability and degradation mechanism?

Understanding supercapacitors' long-term stability and degradation mechanisms is crucial, particularly concerning environmental factors. Research into applications in flexible electronics and wearables is still nascent, and developing supercapacitors that meet specific requirements for these uses is necessary. 9.1.
