What is a flywheel-storage power system?

A flywheel-storage power system uses a flywheel for grid energy storage,(see Flywheel energy storage) and can be a comparatively small storage facility with a peak power of up to 20 MW. It typically is used to stabilize to some degree power grids,to help them stay on the grid frequency,and to serve as a short-term compensation storage.

How does a flywheel storage facility work?

These storage facilities consist of individual flywheels in a modular design. Energy up to 150 kWh can be absorbed or released per flywheel. Through combinations of several such flywheel accumulators,which are individually housed in buried underground vacuum tanks,a total power of up to several tens of MWh can be achieved.

Can a flywheel store solar energy at night?

The city of Fresno in California is running flywheel storage power plants built by Amber Kinetics to store solar energy, which is produced in excess quantity in the daytime, for consumption at night. Intermittent nature of variable renewable energy is another challenge.

How do fly wheels store energy?

Fly wheels store energy in mechanical rotational energyto be then converted into the required power form when required. Energy storage is a vital component of any power system,as the stored energy can be used to offset inconsistencies in the power delivery system.
