---

Nanoarray structures were designed and constructed on high-purity quartz glass covers, achieving high anti-reflection within the ...

PV modules experience reflection losses of ~4% at the front glass surface. This loss can be mitigated by the use of anti-reflection coatings, which now cover over 90% of ...

Measurements were conducted on four types of commercial plate glass to determine their respective visible transmittance, visible reflectance, solar transmittance, solar reflectance, and ...

In order to reduce the mirroring effect, a new glass with reflective strips placed on top of the solar cell busbars has been tested.

In addition to the superior refractive/reflective properties of solar glass versus standard glass, many PV suppliers use stippled solar glass for their panels. Stippled glass is also used with ...

The thermal emissivity of solar cell cover glasses with differences in glass composition or manufacture and surface texture are evaluated using specular and ...

Despite the abundance of solar radiation, significant energy losses occur due to scattering, reflection, and thermal dissipation. Glass ...

Nanoarray structures were designed and constructed on high-purity quartz glass covers, achieving high anti-reflection within the 350-1100 nm range, the high energy part of ...

Despite the abundance of solar radiation, significant energy losses occur due to scattering, reflection, and thermal dissipation. Glass mitigates these losses by functioning as a ...

Despite the abundance of solar radiation, significant energy losses occur due to scattering, reflection, and thermal dissipation. Glass mitigates these losses by functioning as ...
