What is a BMS battery management system?

Fundamentally, the BMS maintains individual cell balance, tracks the state of health (SOH) and state of charge (SOC), and relays important metrics to external systems. Even the most sophisticated lithium-ion battery pack would be vulnerable to malfunctions and safety risks in the absence of a BMS. How Does a BMS Battery Management System Work?

Why do lithium batteries need a BMS?

The BMS prevents your lithium battery's voltage from going too high (causing overheating and gas release) or too low (leading to permanent damage). Damage occurs if you overcharge (cell voltage gets too high) or over-discharge (cell voltage gets too low) a lithium-ion battery cell. Overcharging occurs when recharging exceeds a battery's safe range.

What are the different BMS architectures for a battery system?

Different battery systems call for different BMS architectures: Centralized: Single controller handles all cell data. Distributed: Module-level sensors report to a central unit. Modular: Smart modules manage subsets of the battery independently. Sensors: Voltage, current, temperature. Microcontroller (MCU): BMS "brain" for logic and data processing.

Are lithium-ion batteries safe to operate without BMS protection?

A: Operating lithium-ion batteries without proper BMS protection is extremely dangerous and not recommended. While basic protection circuits exist, they lack the comprehensive monitoring and management capabilities needed for safe operation.
