What is an uninterruptible power supply (UPS)?

An uninterruptible power supply (UPS) or uninterruptible power source is an electrical apparatus that provides emergency power to a load when the input power source or mains power fails.

What is a dynamic uninterruptible power supply?

For large power units, dynamic uninterruptible power supplies (DUPS) are sometimes used. A synchronous motor/alternator is connected on the mains via a choke. Energy is stored in a flywheel. When the mains power fails, an eddy-current regulation maintains the power on the load as long as the flywheel's energy is not exhausted.

What is an uninterrupted power supply & how does it work?

Uninterrupted power supplies protect electronics from power disturbances. Acting as a safeguard, a UPS provides backup power and ensures uninterrupted operation of your devices. These battery backups work by constantly monitoring the incoming power supply.
