Phase Sequence Voltage Magnitude Frequency Phase Angle Synchronisation of Generators to A Busbar The magnitude of the sinusoidal voltage produced by the generator must be equal to the magnitude of the sinusoidal voltage of the grid. If all other conditions are met but the two voltages are not the same, that is there is a voltage differential, closing of the AC generator output breaker will cause a potentially large MVAR flow. If the generator... See more on electrical-engineering-portal #slideexp11\_A7B9F6
